## MS Finance

### About MS Finance

MS Finance provides a global platform to dealers, lenders and insurance companies for information exchange, paperwork and approval in order to provide an end-to-end solution to a customer.

### Project Requirement

The client required an application to assist the customers in obtaining finance for purchasing their products. The application required automation of all aspects of obtaining finance right from storing customer information, purchasing contract through to credit application and others.

### The Challenge

- Dynamically creating documents from the electronic document library
- Generating PDF documents, to be printed back to back, with automatic scan and read functionality

### Our Solution

RiaEnjolie designed a custom application as per the client's needs. With the help of the application, the customer can complete a purchase contract online with a dealer along with a credit application. The dealer can fill an online loan application on behalf of the customer which is processed by the software and submitted to the bank for review. When the application gets processed, the dealer gets notified and the final loan documents are available to download and sign. The documents get created dynamically from the electronic document library.

### Key Features

- Multi level security
- Completely database driven
- Automatic logic for establishing lenders and insurers
- Complex financial calculations
- Generation of large complex PDF documents representing entire set of government approved loan and insurance documentation
